

Storage. Blending. Homogenisation.

In many processes procedures bulk materials and their processing play a central role. Often it not only involves one material which is fed for processing. Rathermore it is frequently a whole series of materials which require combining, mixing, homogenising andfeeding. As such, logistics for these materials become an important factor for the smooth running of the process stages involved.

SCHADE Lagertechnik has been at home in this arena for more than 135 years and has comprehensive know-how at its disposal for applications in the cement and chemical industry, in the power generation sector, in the handling and processing of minerals and ores as well as in the production of iron, steel or alumunium.
